

The SLICER™

The SLICER™ is an innovative, all-season sled that works both on snow and on grass!

The SLICER's™ smooth contoured shape and low-profile runners enable it to perform well on both packed snow and in deep powder. And by attaching a thin ice surface – made from the included patent pending Icers™ – to the bottom of the The SLICER™ sled, the The SLICER™ can be readily converted from a winter-only snow sled to one that can be used on grass in summer months.

The SLICER's™ high density polyethylene unibody construction makes it not only rugged, but very affordable, too. For less than the price of many snow-only sleds, the SLICER™ can be enjoyed year round, with or without snow!

Icer™ Instructions

1 Open the SLICER's™ rear door and remove the two Icer™ Assemblies from inside. After removing the lid from each Icer™ Assembly (leaving the honeycomb Icer™ inside the container), fill each container with water so that the water just covers the top of the Icer's™ honeycomb openings.

2 Replace the lid on top of the Icer™ and then place the filled Icer™ Assemblies into the freezer. (The two Icer™ Assemblies will easily fit within the freezer portion of standard side-by-side refrigerator/freezers and may be stacked one upon the other for freezing). Once the water in the Icer™ Assembly has fully frozen solid throughout – depending on the temperature of the freezer, it will likely take at least 24 hours for that to occur – the Icer™ Assembly may be removed from the freezer just prior to ice sledding.

3 Briefly hold the Icer™ Assembly upside down under warm running water, or allow several minutes for the exterior surface of the ice to melt before attempting to remove the Icer™ (with attached ice) from the container. Remove the lid from the Icer™ Assembly and pry the Icer™ from the container by pushing down with your thumb on one of the container's four protruding lips, while at the same time lifting up with your other hand on the Icer's™ nearby adjacent flange.

4 With both Icers™ frozen in solid ice and removed from their containers, and with the SLICER™ sled turned upside down so that its bottom is facing up, the Icers™ can be pushed down and snapped into place between the sled runners using the Icer's™ flange/tabs and the SLICER's™ narrow slots that are located on the inside of each runner. If desired, the two empty containers and lids from the Icer™ Assemblies may be stored inside the SLICER™ sled.

5 Ice Sledding works best on smooth lawn or grass surfaces, and in warmer temperatures that promote ice melting and reduced friction during sledding. Depending on the outdoor temperature and humidity, the Icers™ can provide up to two hours of sledding fun. To extend the amount of time spent ice sledding, additional Icers™ may be purchased by contacting the retailer where the SLICER™ sled was purchased or going to icesled.com for assistance.

Technical Specifications

Material Content	High Density Polyethylene
Design Construction	Unibody Style
Product Dimensions	38.0" x 20.3" x 6.3"
Product Weight (as shipped)	10.7 lbs.
Product Weight (without Icers™)	7.6 lbs.
Product Weight (with Icers™)	21.5 lbs.
Carton Quantity	6
Carton Dimensions	38.5" x 20.8" x 21.5"
Carton Weight	70 lbs.
Maximum Carrying Load	200 lbs.
Suggested Retail Price	\$79.99
